Prevent Osteoporosis With Strength and Weight Training

Strength and weight training exercises help to prevent osteoporosis and its progression. Let's examine why strength and weight training for osteoporosis is important for the health of your bones and determine what types of activities provide the most benefits.

How Can Strength and Weight Training Exercises Help Me?

Strength and weight training exercises help to preserve bone mass. They help your bones to remain heavy and dense. Bones which have been affected by osteoporosis are weak and subject to fracturing. They have a spongy or lacy appearance on the inside. When strength and weight training exercises are used in conjunction with a healthy diet, and adequate mineral intake, they diminish the development and progression of osteoporosis. As a result you experience less pain and deformity. Your bones will be more resistant to fractures. With less likelihood of fractures occurring, you will experience a lower risk of developing complications which often result from fractures. These include pneumonia, blood clots, and immobility. You may even increase your lifespan. Your level of independence and quality of life will be maintained or improved. You will be more flexible, feel empowered and experience less stress. By engaging in a regular weight and strength training exercise program, you will feel healthier overall, have more energy, and sleep better at night.

Beginning a Weight and Strength Training Exercise Program

It is important that you perform exercises which meet your individual needs, so consult with your health care provider before beginning an exercise program, particularly if you have a diagnosis of osteoporosis. Your health care provider may advise you to begin a strength and weight training exercise program on your own or the provider may refer you to a physical therapist. If you have been given the go ahead to begin an exercise program independently, you may still want to consider consulting with an athletic trainer for personalized attention.
